

PRODUCT CLASSIFICATIONS & ATTRIBUTES

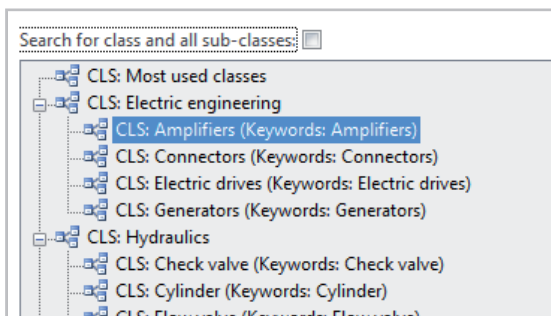

BLUESTAR PLM[®]

PLM inside Dynamics 365 for Operations & AX

PRODUCT CLASSIFICATIONS & ATTRIBUTES

When existing content is hard to find, users spend their time searching for information instead of innovating and they are likely to resort to re-creation. This results in wasted time and duplicate data records that need to be maintained. Bluestar PLM provides a set of powerful search features, which enable users to spend less time searching and more time doing.

Product Classifications

Featuring a hierarchical product classification system, Bluestar PLM enables users to browse a hierarchical classification tree in search of classified objects.

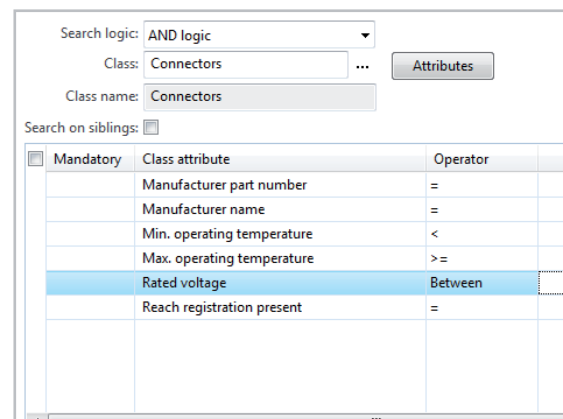

The classification tree can be configured to match your own classifications or can be delivered out-of-the-box with the ecl@ss cross-industry product data standard for classifications.

Search by Attributes

Each classification can be associated with a set of configurable attributes. These attributes can be searched by using a set of pre-defined search operators, e.g. greater than, less than, between, equal to, etc.

This allows users to quickly and accurately locate objects which correspond to one or more attribute values and/or value-ranges.

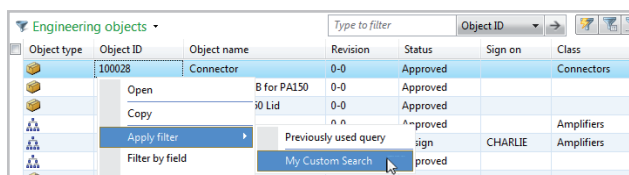

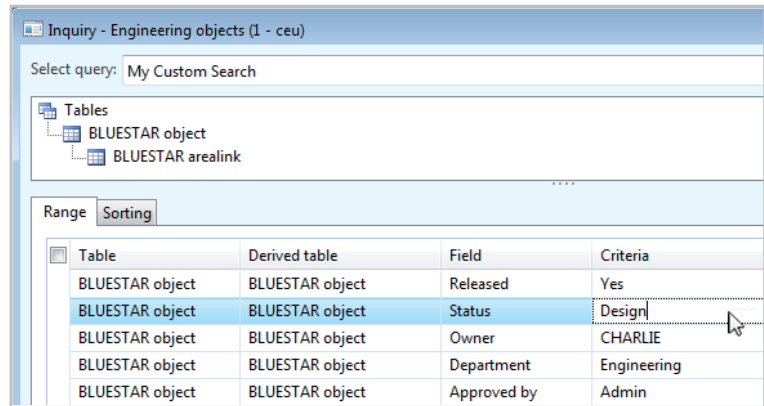

To help combat incomplete data records, attributes can be marked as mandatory, preventing objects from being approved without the mandatory attribute fields having been populated with appropriate values.

Save Custom Searches

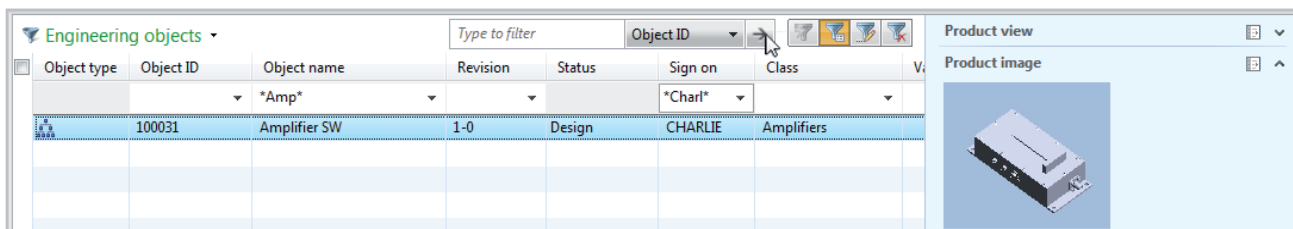

Create and save custom searches as personal favorites for quick repeated use. Simply define which meta-data you wish to search by.

Since all data fields contained in the Bluestar object table and related child tables can be used as search parameters, users can conveniently build highly specific searches.

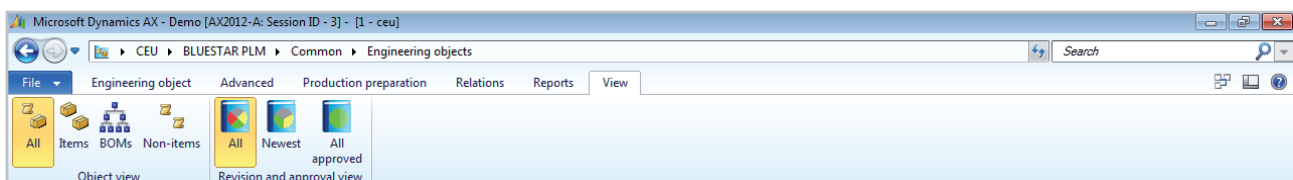

Your custom searches are easily deployed from the right click menu available on the overview list page.

Meta-Data-Filters

From the overview list page, meta-data filters allow users to search based on data contained in the columns displayed. Users can decide what data they want to be filterable by selecting data to be displayed in the columns. In this way, users can easily personalize their overview list page.

Views

In addition to the search tools, preconfigured views are available, allowing users to control which objects are displayed in the overview list page.
